- **Project is the root of a STEP-NC file**
 - Points to the main workplan
 - Points to one or more workpiece
- **Setups describe how the workpieces are oriented on the machine**
 - A setup may contain many workpieces, or multiple occurrences of one workpiece
- **Questions**
 - How are these represented in the AIM?

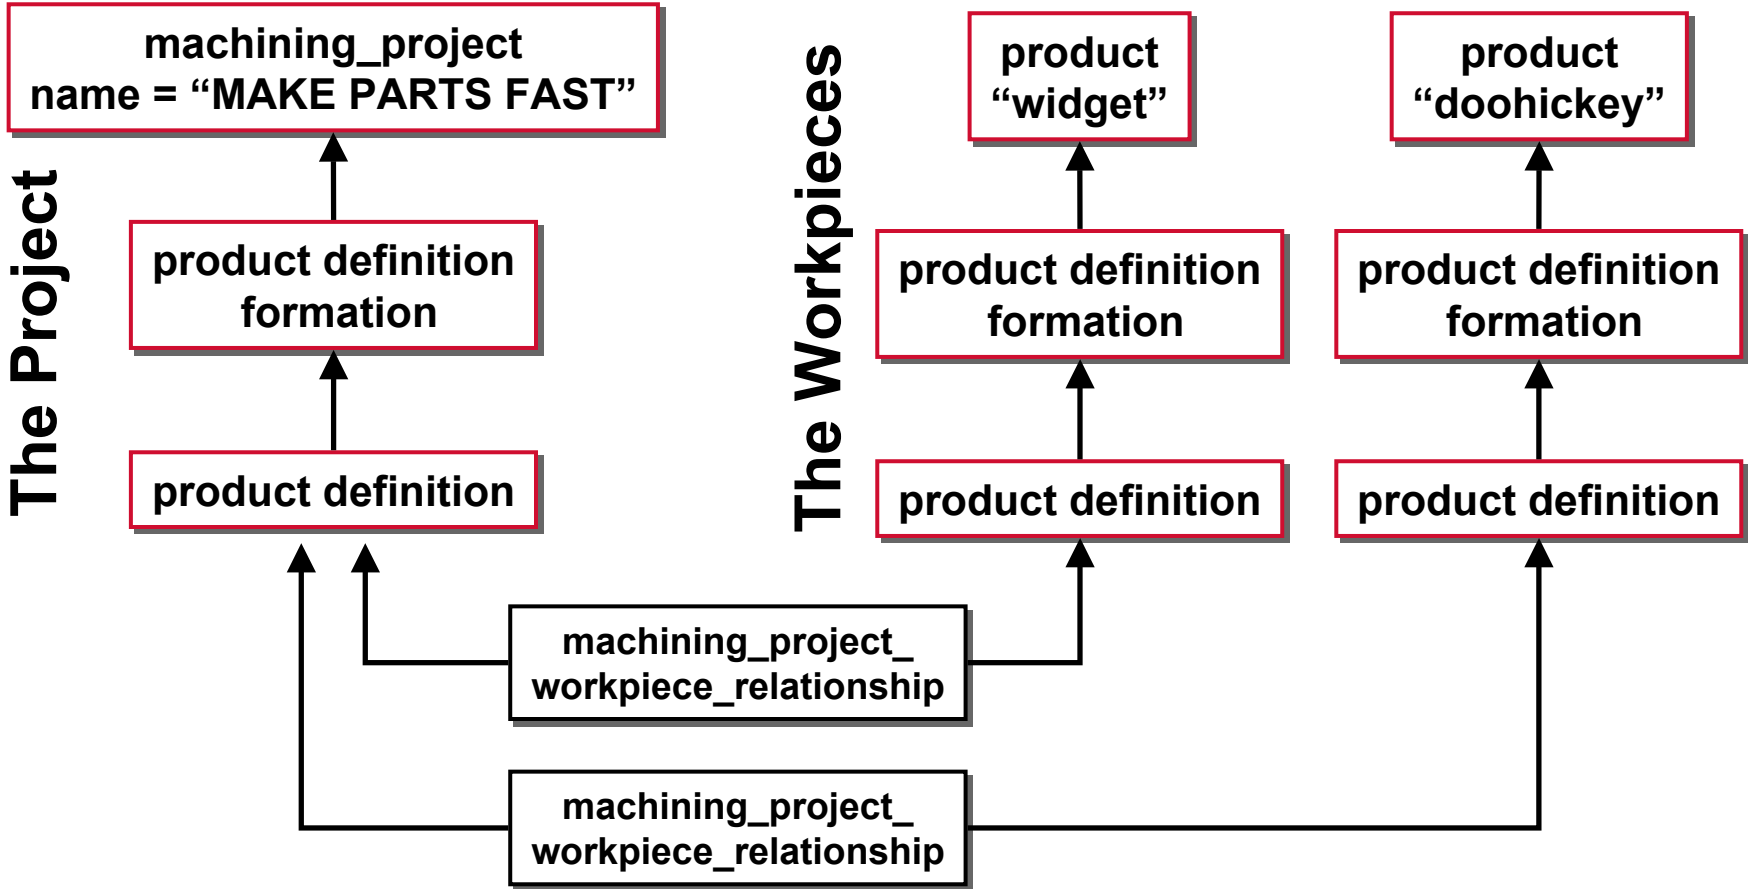

- **Project is represented as a product**
 - We can use all of the PDM information to track the project as well as the workpieces
 - Use the product subtype “machining_project”
 - Workpieces just use product.
- **Project has a workplan and set of workpieces**
 - Workplan related as previously described
 - Workpieces are related using a product_definition_relationship subtype called machining_project_workpiece_relationship

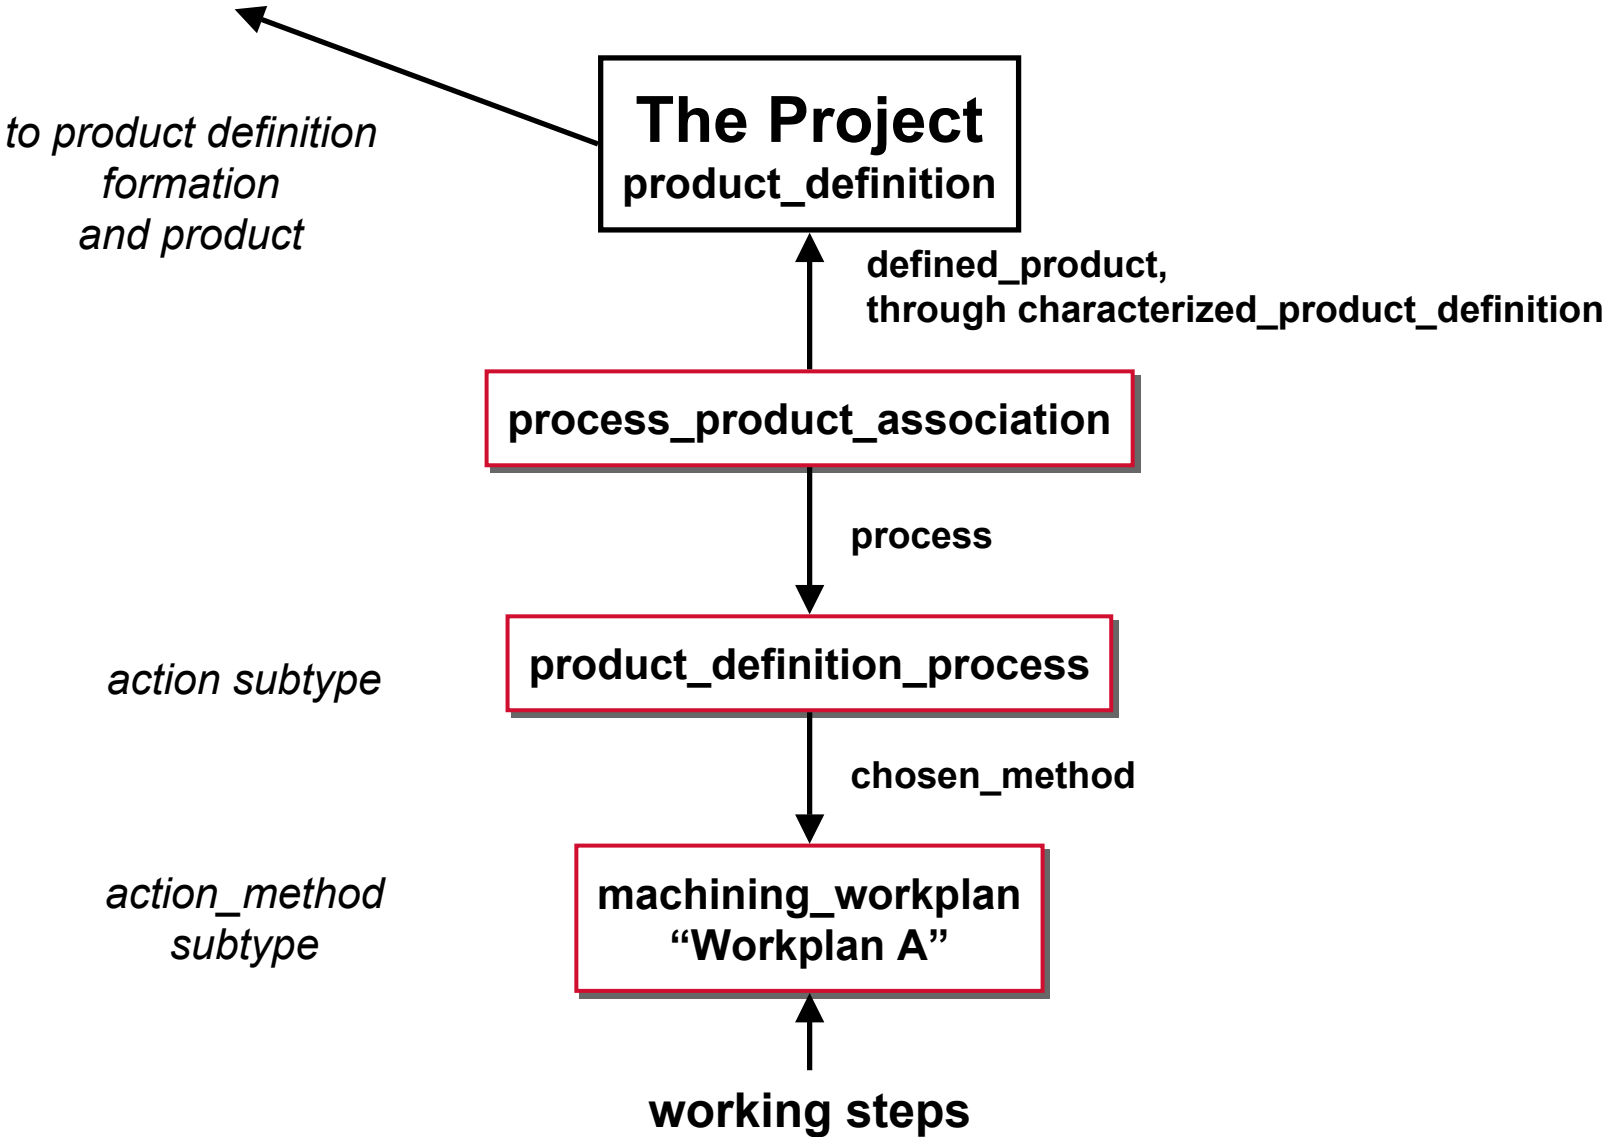

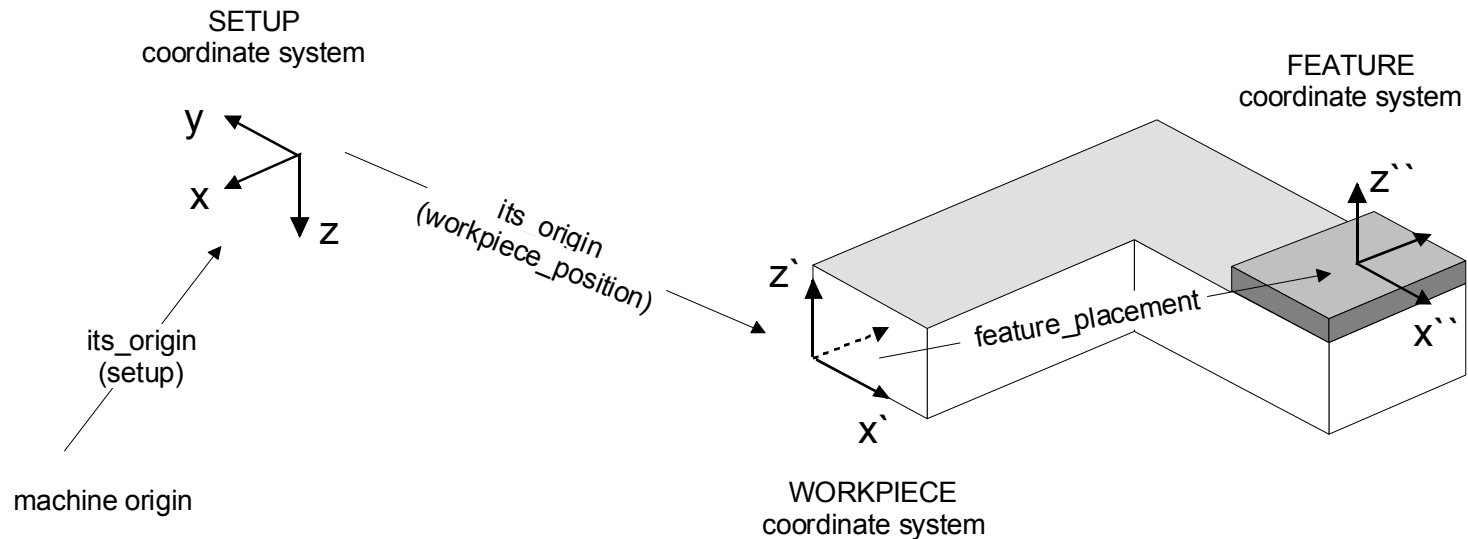

**Design owner, approvals
dates and times**

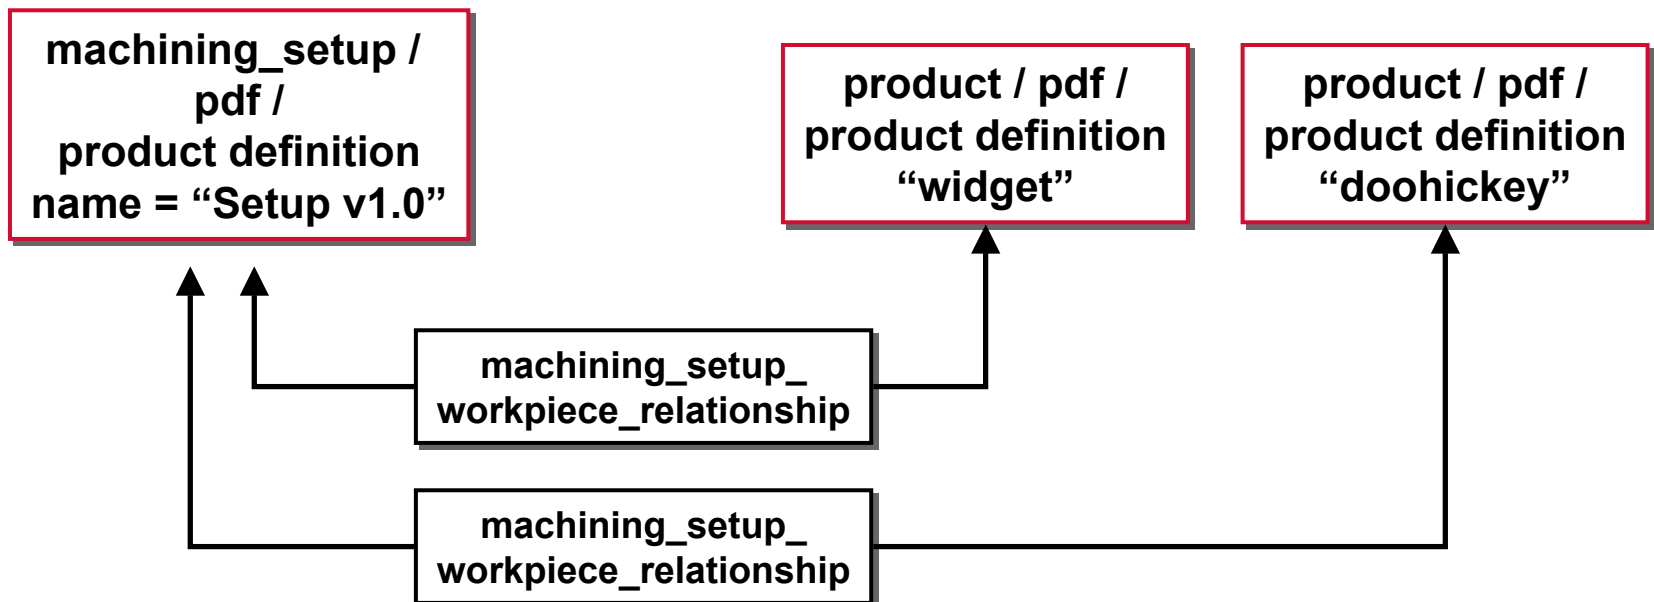

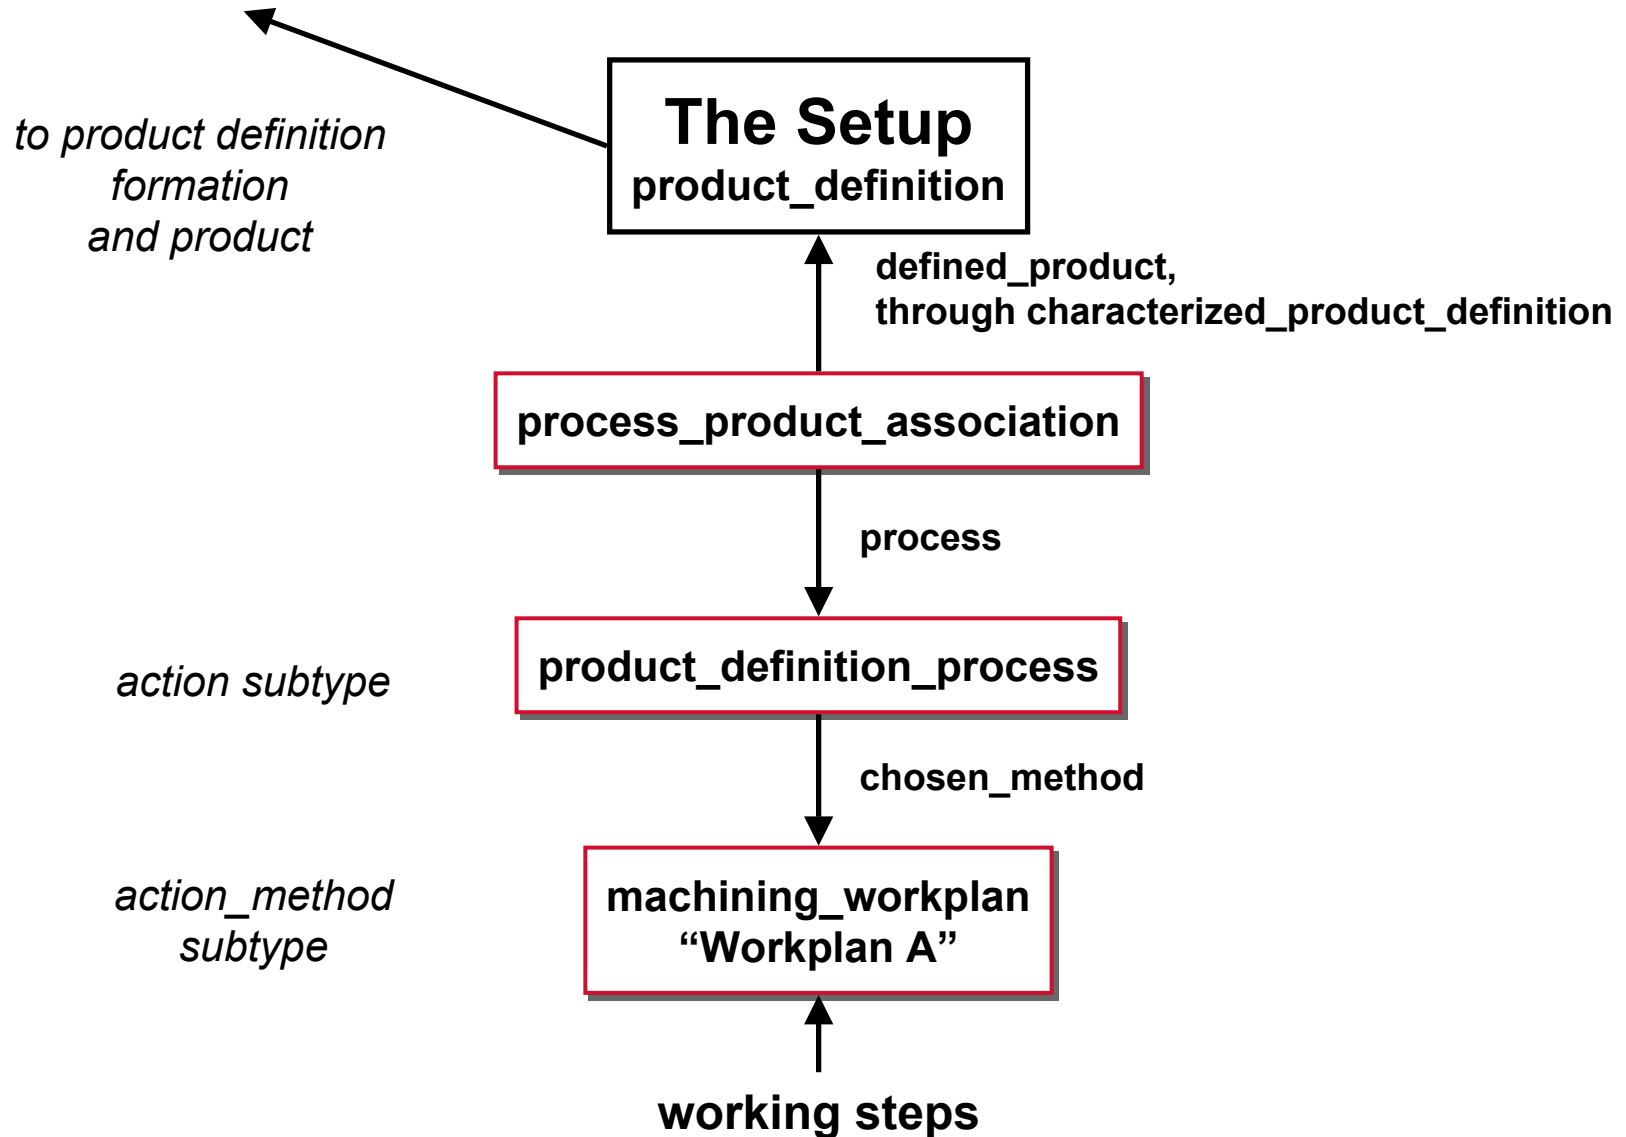

- **A setup describes the orientation and locations of workpieces on the machine**
 - Referenced by a workplan
 - Conceptually similar to an assembly
 - A setup may have many copies of the same workpiece
 - Also describes “keep out” regions where fixtures may be.

- **Handled in the same way as machining projects**
 - A product subtype machining_setup
 - Relates to workpiece with a product_definition_relationship subtype machining_setup_workpiece_relationship
 - Transform within the setup are handles in the same way as STEP assemblies — with item-defined transforms.

- **The placement of the workpiece within the setup is handled with a context dependent shape rep.**
 - Context-dependent shape representation relates an item defined transform to the relationship.
 - The item-defined transform points to an a2p3d in the setup's product definition shape that gives the workpiece offset.
 - Also points to an a2p3d in the workpiece shape that gives the origin for the workpiece.
- **This is the same technique used for describing the offset of components within an assembly.**

- **Project is the root of a STEP-NC file**
 - Points to the main workplan
 - Points to one or more workpiece

 - Mapped as machining_project product subtype

- **Setups describe how the workpieces are oriented on the machine**
 - Referenced by a workplan.

 - Mapped as machining_setup product subtype
 - Similar to a mechanical assembly, needs a bit more investigation to make sure it is harmonized.
